

Keep an approach trajectory on course

One fixed berth, a planned path and changing wind/current; recommend an abstract correction.

Goal: tighter tracking under disturbances. Compare maintain-only, reactive and predictive policies.

Fixed berth Trajectory tracking, not berth selection	6 actions × 6 steps Simulator look-ahead ranks advice	Operator authority Accept/override in a real deployment
--	---	---

Two experiments, with different prediction engines

The learned next-state predictor is evaluated separately; action ranking uses simulator rollouts.

Rank six actions through a 12-second look-ahead

score_action() uses the current environment held fixed across six 2-second simulator steps.

Source: src/recommender.py. Abstract dynamics and demonstration weights; not certified navigation limits.
